WPI; 2003-300858/29.

Novel isolated nucleic acid derived from Nicotiana benthamiana, Oryzae sativa, Saccharomyces cerevisiae, and Papaver rhoeas, useful for conferring altered visual phenotypes in plants.

Claim 1; SEQ ID NO 1848; 517pp; English.

This invention relates to the identification and isolation of novel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/ or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel phenotypes can affect growth regulation i.e. useful for creating dwarf varieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or delayed sensescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual penerating transgenic plant seeds, plant tissues and plant cells containing the polymucleotides described herein. This polymucleotide is a homologue of a DNA sequence that confers an altered visual phenotype when expressed in plants, the method of the invention.

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone
probably contains an inverted insert. The sequence has been trimmed
and the T residues removed.
                                                                                                                                                                                                                                                                                 AA695154 linear EST 23-APR-2001 GM02326.3prime GM Drosophila melanogaster ovary BlueScript Drosophila melanogaster cDNA clone GM02326 3prime, mRNA sequence.

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyadenylated. The resulting Poly-T sequence has been removed. hit

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyaden/lated. The resulting Poly-T sequence has been removed. hit

Bioremediative microorganism for dechlorinating chlorinated biphenyls and for bioremediation, comprises a specific 168 ribosomal subunit nucleic for bioremedia acid sequence.

Claim 1; Fig 22; 102pp; English.

The present invention relates to bioremediative microorganisms comprising 16S ribosomal subunit nucleic acid sequence. The microorganisms of the invention are useful for dechlorinating polychlorinated biphenyls (PCBs) including anaerobic dechlorination of ortho- and double-flanked chloro substituents of PCBs. They are useful for biodegradation of halogenated organic waste, e.g., contaminated soil from landfill sites and river beds containing PCBs and to treat leachates and aqueous surfactant solutions resulting from washing the organic waste to transfer PCBs to the aqueous surfactant solutions. The method of the invention is useful for

The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      involves contacting a chlorinated compound with the organism. Oligomuclectide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is Dehalococcoides related family A 165 DHFA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

determining the bioremediative potential of CB-containing site, which is useful for monitoring CB-containing site. The invention also relates to compositions which are useful for bioremediation. The present sequence is a 16S ribosomal DNA (rDNA) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to compositions and methods for bioremediation of polychlorinated biphenyls (PCBs) using dechlorinating microorganisms grown in the presence of stimulating halogenated hydrocarbons and polyhalogenates. Polyhalogenated ethenes are used to stimulate the growth and dechlorinating activity of PCB dechlorinating bacteria in a contaminated soil or sediment. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23S rRNA genes, including the far downstream end of the 16S and the far upstream end of the 23S and the far upstream end of the 23S and the far upstream end of the 23S and 13D region in the 3T end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are probes can be used to identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals. AAH28371-AAH28413 represent intergenic spacer target sequences, derived from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23S rRNA genes, including the far downstream end of the 16S and the far upstream end of the 23S domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, on to distinguish one strain from another, and for diagnosing chlamydia! infections in humans and animals. Intergenic spacer between 16S and 23S rRNA genes of strain CWL-029.

RESULT

셤

ò

```
AAH28371-AAH28413 represent intergenic spacer target sequences, derived from Chlamydiaceae. The sequences comprise the intergenic spacer between the 16S and the 23S FWA genes, including the far downstream end of the 16S and the far upstream end of the 23S domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals. ```
AAH28171-AAH28413 represent intergenic spacer target sequences, derived from Chlamydiaceae. The sequences comprise the intergenic spacer between the 165 and the 235 rRNA genes, including the far downstream end of the 165 and the far upstream end of the 235 domain I flanking intergenic spacer (referred to as Region A), and secondarily, a 131 bp region in the 3' end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for disaposing chlamydial infections in humans and animals. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           168 rDNA; dechlorinating activity; chlorinated compound; vinyl chloride; carbontetrachloride; tetrachloroethane; chloroform; dichloromethane; trichloroethane; dichloroethylene; chlorinating bacteria; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            etherogenes strain STF, isolated from soil surrounding an industrial site. The 16S rDNA profile is linked to dechlorinating activity.

Bacterial strain comprising the 16S rDNA sequence of the invention are useful for the dechlorination of chlorinated compounds such as carbontetrachloride, tetrachloroethane, chloroform, dichloromethane, tichloroethane, dichloroethylene, vinyl chloride, and chloroaromatics. The 16S rDNA sequence is also useful for identification of new chlorinating bacteria, as well as sub-typing strains of Dehalococcoides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence represents the 16S rDNA profile of Dehalococcoides
spacer (referred to as Region.A), and secondarily, a 131 bp region in t 3 end of Domain I (referred to as Region B). The sequences provide suitable target sequences for developing probes and primers which are useful for identifying and detecting Chlamydiaceae. The primers and probes can be used to identify the presence of Chlamydiaceae in a test sample, or to distinguish one strain from another, and for diagnosing chlamydial infections in humans and animals.                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism. Oligonucleotide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating to useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism that is a involves contacting a chlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism. Oligonucleotide polymer of the invention is useful for separating chlorinating chlorinating chlorinating chlorinating chlorinating subfamilites of dechlorinating bacterial organism. The present sequence is

                                                                                                                ò
                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contracting a chlorinated compound with the organism. Oligonuclectide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is
                                                                                            dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism.

Oligonucleotide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is behalococcoides ethenogenes 165 rDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in
Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples.
                                                                                      invention relates to an isolated 16S rDNA sequence indicative of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated 16S rDNA sequence indicative of a dechlorinating bacterial organism. The invention is useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in various samples. The method of the invention is useful for identifying a dechlorinating bacterial organism that is a member of a cell population or consortium. The isolated bacterial organism is useful for dechlorinating chlorinated compounds which involves contacting a chlorinated compound with the organism.

Involves contacting a chlorinated compound with the organism.

Oligonuclectide polymer of the invention is useful for separating subfamilies of dechlorinating bacterial organism. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated 16S rDNA sequence useful for forming probes and primers which are useful for identifying dechlorinating bacterial organism in

The present sequence represents the 16S rDNA profile of Dehalococcoides ethenogenes strain 195. The 16S rDNA profile is linked to dechlorinating activity. Bacterial strain comprising the 16S rDNA sequence of the invention are useful for the dechlorination of chlorinated compounds such as carbontetrachloride, tetrachloroethane, chloroform, dichloromethane, trichlorocethane, dichlorocethylene, vinyl chloride, and chloroacomatics. The 16S rDNA sequence is also useful for identification of new chlorinating bacteria, as well as sub-typing strains of Dehalococcoides
                                                                                                                     168 rDNA; dechlorinating activity; chlorinated compound; vinyl chloride; carbontetrachloride; tetrachloroethane; chloroform; dichloromethane; trichloroethane; dichloroethylene; chlorinating bacteria; ss.
                                                                                    A 16S rDNA sequence indicative of a chlorinating bacterial strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New 16S rDNA profile derived from Dehalococcoides ethenogenes and indicative of a dechlorinating bacterial strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1443 BP; 379 A; 306 C; 443 G; 314 T; 0 U; 1 Other;

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; LOCATION: (256)

Lambda Uni-ZAP XR; Site_1: Eco RI; Site_2: Xho I; Filarial nematode parasite of humans. Two adult female worms of Onchocerca volvulus were isolated from consenting patients and quick frozen. Adult female mRNA was converted to double-stranded CDNA using reverse transcriptaes and oligo (dT) followed by RNase H and DNA pol I. The library has 7 x 10E5 independent recombinants and the average insert size is x=100Dp.The library was constructed by Michalle Lizotte-Waniewski with worms provided by Dr. Sara Lustigman. The library is available

analysis were selected following oligonuclectide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                      ö
